## For Teachers

### Introduction

*Understanding Electrolysis* is aimed at Years 11 and 12 Chemistry and deals with an area that students often find difficult. Electrochemical cells have many uses both in industry and everyday life. They include galvanic cells (batteries) that use chemical reactions to generate electricity and electrolytic cells that use electricity to drive chemical reactions. The concepts of electrochemical cells are dealt with in detail, starting with basic principles, and using a mixture of actual laboratory equipment and animations. The reactivity series is used to help students understand how electrochemical cells work. Teachers are recommended to review the concepts of redox reactions before viewing the program.

### Timeline

00:00:00	Introduction
00:00:53	Galvanic Cells
00:07:35	Basic Electrolytic cells & operation
00:13:54	Electrolysis in action 1 – production of chemicals
00:18:41	Electrolysis in action 2 – refining and protecting metals
00:23:49	Law of electrolysis
00:28:24	Conclusion
00:29:01	Credits
00:29:47	End program

### ***Student Worksheet***

#### **Initiate Prior Learning**

1. List five devices that use batteries (cells) to provide electrical energy.

---

---

---

---

---

2. What are the major differences between a car battery and a battery used to power a flashlight?

---

---

---

---

---

3. What is the charge on an electron?

---

4. Why are some objects plated with a particular metal (e.g. silver) rather than being made with that metal?

---

---

5. Why do metal atoms form ions?

---

---

### Active Viewing Guide

Complete the following sentences.

1. Chemical reactions can produce \_\_\_\_\_ and electricity can produce \_\_\_\_\_ reactions.
2. Electrolysis can be used to coat and protect \_\_\_\_\_, manufacture industrial \_\_\_\_\_ and refine and purify \_\_\_\_\_.
3. In cells producing electricity there are two \_\_\_\_\_. In one half-cell \_\_\_\_\_ is taking place and in the other \_\_\_\_\_. \_\_\_\_\_ flow through the external circuit causing a current, and \_\_\_\_\_ flow through the salt bridge.
4. Standard reduction electrode potentials compare half cells with that of \_\_\_\_\_. Positive potentials show a metal is more easily \_\_\_\_\_ and less easily \_\_\_\_\_ than hydrogen.
5. The reactions in electrolytic cells are non \_\_\_\_\_ and require \_\_\_\_\_ energy to proceed.
6. Water is a \_\_\_\_\_ substance and doesn't conduct electricity well unless e.g. an acid is added to make it an \_\_\_\_\_. Electricity causes the water to decompose and \_\_\_\_\_ gas is given off at the anode; and \_\_\_\_\_ gas at the cathode in the ratios of 1:2. Oxygen \_\_\_\_\_ a glowing splint and hydrogen \_\_\_\_\_ when it is ignited with a lit splint.
7. Industry uses electrolysis to produce metals such as \_\_\_\_\_ as well as the gases \_\_\_\_\_ and \_\_\_\_\_ from \_\_\_\_\_ (Sodium chloride solution).

## Understanding Electrolysis

---

8. Sodium \_\_\_\_\_ (NaOH) is a strong \_\_\_\_\_ and is used in the manufacture of \_\_\_\_\_, \_\_\_\_\_, paper and textiles. Chlorine is used in the manufacture of the plastic \_\_\_\_\_ (PVC) and in the purification of \_\_\_\_\_.
9. \_\_\_\_\_ ( $\text{Al}_2\text{O}_3$ ) is smelted using vast quantities of \_\_\_\_\_ to produce aluminum. Cryolite is added to \_\_\_\_\_ its melting point. In the process the carbon anode is oxidized to form \_\_\_\_\_. Aluminum can be \_\_\_\_\_, which only uses a fraction of the \_\_\_\_\_ needed to produce it from its ore.
10. Metals often have a surface coating of an \_\_\_\_\_ and this can be increased by \_\_\_\_\_ to protect the metal (e.g. \_\_\_\_\_) against further corrosion.
11. Silver and \_\_\_\_\_ are two metals often used to plate other metals. The object to be plated is the \_\_\_\_\_ and the metal used for plating is the \_\_\_\_\_. A similar process is used to \_\_\_\_\_ copper on an industrial scale.
12. Some batteries (cells) can be \_\_\_\_\_. These include the \_\_\_\_\_-acid battery used in cars, nickel \_\_\_\_\_ (NiCad), nickel metal hydride and \_\_\_\_\_-ion batteries.
13. Faraday's First Law of electrolysis states that the quantity of a substance consumed or produced at an electrode is \_\_\_\_\_ to the \_\_\_\_\_ used. This is expressed in the formula,  $Q = I \times t$ , where  $Q =$  \_\_\_\_\_,  $I =$  \_\_\_\_\_ (amps) and  $t =$  \_\_\_\_\_ (seconds)

## Understanding Electrolysis

---

14. Faraday's \_\_\_\_\_ relates the quantity of electricity (measured in \_\_\_\_\_) to the quantity of \_\_\_\_\_ passing through the circuit.
15. Silver ions have a single positive charge so one \_\_\_\_\_ of silver ions will need one mole of electrons to be reduced. Reduction takes place at the \_\_\_\_\_. The mass of metals deposited is the product of the number of \_\_\_\_\_ multiplied by the \_\_\_\_\_ (ram)

## Extension Activities

1. Explain the difference between oxidation and reduction.

---

---

---

---

---

---

For questions 2 & 3 refer to the galvanic cell. (Figure 1)

2. On the diagram show polarities (+/-) of the electrodes.
3. On the diagram show the flow of electrons

## Understanding Electrolysis

For questions 4, 5 & 6 refer to the electrolytic cell (Figure 2) which was set up to plate a key with copper.

4. On the diagram show polarities (+/-) of the electrodes.
5. Write an equation for the reaction occurring at the copper electrode.

6. Suggest a suitable electrolyte.

7. Figure 3 shows a Hoffman voltameter. Outline how it operates.

---

---

---

---

---

## Understanding Electrolysis

---

8. Balance the equation showing the electrolysis of brine. Include symbols of state.

9. Figure 4 shows a cell used to smelt aluminum. Label the figure showing anode, cathode and alumina.

Figure 4

---

---

---

10. Balance the equation.  $\text{Al}_2\text{O}_3 \rightarrow \text{Al} + \text{O}$ . Include symbols of state.

-

### ***Suggested Student Responses***

#### **Initiate Prior Learning**

1. List five devices that use batteries (cells) to provide electrical energy.  
**Answers will vary but could include:**  
**Radio**  
**MP3 player**  
**Mobile phone**  
**Flashlight**  
**Digital camera**  
**Electric vehicle**
2. What are the major differences between a car battery and a battery used to power a flashlight?  
**Size**  
**Current**  
**Length of time it can be used**  
**Recharge capacity**  
**Chemicals used in manufacture**
3. What is the charge on an electron?  
**Negative**
4. Why are some objects plated with a particular metal (e.g. silver) rather than being made with that metal?  
**Much cheaper and confers same properties**
5. Why do metal atoms form ions?  
**To achieve full outer shell (octet/noble gas structure)**

### Active Viewing Guide

Complete the following sentences.

1. Chemical reactions can produce **electricity** and electricity can produce **chemical** reactions.
2. Electrolysis can be used to coat and protect **metals**, manufacture industrial **chemicals** and refine and purify **metals**.
3. In cells producing electricity there are two **half-cells**. In one half-cell **oxidation** is taking place and in the other **reduction**. **Electrons** flow through the external circuit causing a current, and **ions** flow through the salt bridge.
4. Standard reduction electrode potentials compare half cells with that of **hydrogen**. Positive potentials show a metal is more easily **reduced** and less easily **oxidized** than hydrogen.
5. The reactions in electrolytic cells are non **spontaneous** and require **electrical** energy to proceed.
6. Water is a **molecular** substance and doesn't conduct electricity well unless e.g. an acid is added to make it an **electrolyte**. Electricity causes the water to decompose and **oxygen** gas is given off at the anode; and **hydrogen** gas at the cathode in the ratios of 1:2. Oxygen **relights** a glowing splint and hydrogen "**pops!**" when it is ignited with a lit splint.
7. Industry uses electrolysis to produce metals such as **aluminum** as well as the gases **chlorine** and **hydrogen** from **brine** (sodium chloride solution).
8. Sodium **hydroxide** (NaOH) is a strong **base** and is used in the manufacture of **soaps**, **detergents**, paper and textiles. Chlorine is used in the manufacture of the plastic **polyvinyl chloride** (PVC) and in the purification of **water**.
9. **Alumina** ( $\text{Al}_2\text{O}_3$ ) is smelted using vast quantities of **electricity** to produce aluminum. Cryolite is added to **lower** its melting point. In the process the carbon anode is oxidized to form **carbon dioxide**. Aluminum can be **recycled** which only uses a fraction of the **energy** needed to produce it from its ore.
10. Metals often have a surface coating of an **oxide** and this can be increased by **anodizing** to protect the metal (e.g. **aluminum**) against further corrosion.
11. Silver and **chrome** are two metals often used to plate other metals. The object to be plated is the **cathode** and the metal used for plating is the **anode**. A similar process is used to **refine** copper on an industrial scale.
12. Some batteries (cells) can be **re-charged**. These include the **lead**-acid battery used in cars, nickel **cadmium** (NiCad), nickel metal hydride and **lithium-ion** batteries.
13. Faraday's First Law of electrolysis states that the quantity of a substance consumed or produced at an electrode is **proportional** to the **electricity** used. This is expressed in the formula,  $Q = I \times t$ , where  $Q =$  **coulombs**,  $I =$  **current** (amps) and  $t =$  **time** (seconds)
14. Faraday's **constant** relates the quantity of electricity (measured in **coulombs**) to the quantity of **electrons** passing through the circuit.
15. Silver ions have a single positive charge so one **mole** of silver ions will need one mole of electrons to be reduced. Reduction takes place at the **cathode**. The mass of metals deposited is the product of the number of **mole** multiplied by the **relative atomic mass** (ram)

### Extension Activities

1. Explain the difference between oxidation and reduction.  
**Reduction is the gain of electrons and is a decrease in oxidation state/number. Oxidation is the loss of electrons and is a decrease in oxidation state/number.**

For questions 2 & 3 refer to the galvanic cell. (Figure 1)

2. On the diagram show polarities (+/-) of the electrodes.  
**The zinc electrode is negative and the copper is positive.**
3. On the diagram show the flow of electrons  
**Electrons are flowing from zinc to copper through the external circuit (i.e. through the voltmeter)**

For questions 4, 5 & 6 refer to the electrolytic cell (Figure 2) which was set up to plate a key with copper.

4. On the diagram show polarities (+/-) of the electrodes.  
**The copper electrode is positive and the key is negative.**
5. Write an equation for the reaction occurring at the copper electrode.  
 **$\text{Cu(s)} \rightarrow \text{Cu}^{2+}(\text{aq}) + 2\text{e}^{-}$**
6. Suggest a suitable electrolyte.  
**Copper sulphate**

## Understanding Electrolysis

7. Figure 3 shows a Hoffman voltameter. Outline how it operates.

Figure 7

**DC current is supplied to the (unreactive) electrodes. Hydrogen is given off at the negative cathode and oxygen is given off at the positive anode in the ratio of 2:1.**

8. Balance the equation showing the electrolysis of brine. Include symbols of state.

9. Figure 4 shows a cell used to smelt aluminum. Label the figure showing anode, cathode and alumina.

Figure 8

**The anode is the positive terminal (carbon), the cathode is the negative terminal (casing) and the alumina is the contents of the cell**

10. Balance the equation.  $\text{Al}_2\text{O}_3 \rightarrow \text{Al} + \text{O}$ . Include symbols of state.  
 $\text{Al}_2\text{O}_3(\text{l}) \rightarrow 2\text{Al}(\text{l}) + 1\frac{1}{2}\text{O}_2(\text{g})$  or  $2\text{Al}_2\text{O}_3(\text{l}) \rightarrow 4\text{Al}(\text{l}) + 3\text{O}_2(\text{g})$
